

Setting a Google Test Project and Run Assignments Tests

1. Create a new Google Test C++ project from VS 2022

2. Create in the project a new file named "Assignment.h". Copy in this file the content of the your class (class definition and methods implementation) **without main(). The first line must be #pragma once as in the given file**
3. In the existing test.cpp file copy the content of the given test.cpp file. If you named previous Assignment.h file differently you need to update the #include "Assignment.h" to the new name
4. Build the project and fix errors (if any)
5. To run the tests open test.cpp file and the View -> Test Explorer and click Run All

- 6.** Implement assignment requirements in Assignment.h file by completing the methods body.
- 7.** Don't change pch.cpp and pch.h
- 8.** If you need to do your own tests you need a separate C++ project where you can have a main() method.
- 9.** For questions use the class Slack workspace
